QUALITATIVE ANALYSIS

Betting-Previews is a tipster verified by Bettin.gs, BetRush, MyBigPartner and proofing to SecretBettingClub. Betting-Previews offers a PREMIUM service, with an affordable price of 24.99 € per month, which means about 0.64€ per pick (considering the average picks/month). To date, Betting-Previews focuses on International - local and regional - Soccer Competitions, being the Asian Handicap (almost) exclusively the type of bet used. The preferred bookies are Pinnacle and, in a lesser extent, SBOBET.

The size of the sample (number of picks and months) is still statistically insignificant (reason why both parameters appear in red). Therefore, it is worth clarifying that the analysis presents some extent of uncertainty.

Since July 2016 Betting-Previews uses Flat Stake (1 unit per pick, see graph n.3). In the service description is stated that "1 Unit = 1% of your total betting bankroll. 100 Units is a recommended bankroll + 25 Units on the side to add some extra comfort at the losing runs."

The total Yield obtained after 470 picks - till November 2016 - is 7.21%. This value is slightly below the average of analysed tipsters within the DataBase (tipstuni.com/tipsters-database/). In terms of results consistency, parameter that may be measured by observing the evolution of the yield over time (see graph n.1), there is a significant difference between the maximum and minimum values (yield variation has resulted in red, with a value of 171.38%). This is usual among tipsters with still low sample of picks. Generally, this trend should stabilize over time.

The Accumulated Profit curve (see Graph n.4) shows that after a good-success starting period (up to the first 150 picks approx.) followed some short-time runs alternating good and bad results. In fact, the Maximum DrawDown calculated appears in the last period, particularly in a range of about 100 picks. However, Betting-Previews is right now recovering from such a drop, and ended November 2016 with a profit close to the Maximum ever reached. The maximum DD (DrawDown) calculated is 13.37%. This value is remarkably good in comparison to the normalized values of the tipsters database analyses done.

The WinRate (which measures the percentage of successful picks) presents good values, higher than 50% by using average odds near to 2.00. This factor implicitly indicates that Betting-Previews is capable to find value-bets. However the relationship WR-Odds varies notoriously (see graph n.5), which suggests that Betting-Previews must enhance the calculation of probability-of-success estimation. In optimal terms, the R2 correlation factor should be the closest to 1 as possible.

The average odds in which Betting-Previews moves range from 1.90 to more than 2.20 (see graph n.2). As one may take out from observing the plot, there is some variability in the selected odds but within boundaries more than acceptable.

In summary, Betting-Previews is a tipster perfectly suitable to be included in the Tipster Universe DataBase.
